

Anatomy of a synthetic note

One demographics-neutral GENIE BPC case (GENIE-MSK-P-0012061), color-coded by where each fact came from

Real GENIE BPC structured field LLM narrative scaffold (Gemini-2.5-flash) LLM-generated detail — not in GENIE (disclosed)

HPI
82-year-old individual with a history of former tobacco use , presenting for an initial oncology consultation for newly diagnosed metastatic non-small cell lung cancer . Two-month history of a persistent non-productive cough and progressive dyspnea on exertion ; fully ambulatory, ECOG performance status 1 .

Diagnostic Workup
CT of the chest revealed a 4.5 cm spiculated right-upper-lobe mass with contralateral pulmonary nodules and a moderate right pleural effusion . CT-guided core-needle biopsy confirmed adenocarcinoma ; pleural cytology positive . AJCC Stage IV (cT3 N0 M1a) ; brain MRI negative for metastases .

Molecular Studies
Next-generation sequencing identified a MET exon 14 skipping mutation and a KRAS G12C mutation . Negative for EGFR, ALK, ROS1, BRAF, RET, NTRK, ERBB2 . Tumor mutational burden intermediate ; PD-L1 not tested .

Real patient = MSK, 82-year-old former smoker. The real demographics (Asian male) are REMOVED to make the neutral base note; the 30 demographic variants are injected on top. Structured fields (green) are GENIE ground truth; the prose that carries them (blue) and specific clinical details like tumor size or symptom timeline (amber) are model-generated.
