

Control-cohort restriction for the hard-endpoint bias-gap analysis

Control = no_demographics reference (not white_male_private). Cases are restricted to those where the model's own no_demographics recommendation is already NCCN-guideline-concordant, before computing the HARD (downgrade) bias-gap; retention varies by model. The SOFT (stigma-framing) endpoint is unaffected and uses the full n=1,048 sample.
